

In The Claims:

1. (Previously Presented) An apparatus comprising:

a server configured to distribute requested video assets to requesting user equipment via an access network, the server comprising:

a storage medium comprising a primary storage partition configured to store frequently requested video assets and a secondary storage partition configured to store infrequently requested video assets a manager configured to manage migration of video assets, wherein the manager is configured to track asset request rates and threshold rates of respective video assets;

wherein the manager, in response to an infrequently requested video asset becoming frequently requested, is configured to select and transmit the frequently requested video asset to at least one primary partition of at least one server ;

wherein the manager, in response to a frequently requested video asset becoming infrequently requested, is configured to select and transmit the infrequently requested video asset to at least one secondary partition of at least one server .

2. (Previously Presented) The apparatus of claim 1, wherein:

the manager is configured to identify an infrequently requested video asset as becoming frequently requested when the asset request rate crosses above the threshold rate; and

the manager is configured to identify a frequently requested video asset as becoming infrequently requested when the asset request rate crosses below the threshold rate.

3. (Previously Presented) The apparatus of claim 2, wherein:

in response to receiving a request for a video asset from requesting user equipment, the manager is configured to control distribution of the requested video asset

from one of the servers identified as storing the requested video asset to the requesting user equipment.

4. (Previously Presented) The apparatus of claim 3, wherein the server is a local server and the apparatus is operatively connected to a remote server comprising a storage medium having a primary partition and a secondary partition, the apparatus further comprising:

- a content manager configured to receive the request for the video asset and determine whether the requested video asset is stored locally in the storage medium of that local server at which the video asset request is received or stored remotely in the storage medium of the remote server;

- a stream session manager configured to direct a server to distribute streams of video assets to user equipment requesting the video assets; and

- a content session manager configured to respond to video asset requests forwarded from managers of other server.

5. (Cancelled)

6. (Currently Amended) The apparatus of claim 4, wherein a content manager of the local server at which a video asset request is received, in response to determining that a requested video asset is stored locally, is configured to notify the stream session manager to deliver the requested video asset ~~to the local server for transmission~~ by the local server to the requesting user equipment via the access network.

7. (Previously Presented) The apparatus of claim 4, wherein the content manager of a local server at which a video asset request is received, in response to determining that a requested video asset is stored remotely in the storage of a remote server, is configured to instruct the stream session manager of the local server to contact the content session manager of the remote server.

8. (Previously Presented) The apparatus of claim 7, wherein the content session manager of the remote server is configured to identify the requested video asset in the storage of the remote server, allocate bandwidth for transmitting the requested video asset, and, in response to a determination that the requested video asset is to be provided from the remote server to the requesting user equipment via the local server, notify the server of the remote server to transmit the requested video asset to the local server using the access network.

Claims 9-18 (Cancelled)

19. (Previously Presented) A computer-implemented method comprising:

- determining an asset request rate for a plurality of video assets stored in each of a plurality of servers;

- comparing the determined asset request rates with respective threshold rates of the plurality of the video assets; in response to an infrequently requested video asset becoming frequently requested, selecting and transmitting the frequently requested video asset to at least one primary partition of at least one server;

- in response to a frequently requested video asset becoming infrequently requested, selecting and transmitting the infrequently requested video asset to at least one secondary partition of at least one server.

20. (Cancelled)

21. (Previously Presented) The method of claim 19, further comprising:

- for each infrequently requested video asset that becomes a frequently requested video asset, removing the infrequently requested video asset from the secondary storage partition; and

- for each frequently requested video asset that becomes an infrequently requested video asset, removing the infrequently requested video assets from each of the primary storage partitions of the servers on which the frequently requested video asset was stored.

22. (Previously Presented) The method of claim 19, further comprising:

- receiving, at one of the servers, a request for a video asset;
- identifying a server storing the requested video asset, wherein the server comprises one of the local server at which the video asset request is received or one of the other servers remote from the server at which the video asset request is received;
- causing the identified server storing said requested video asset to begin providing the requested video asset; and
- transmitting the requested video asset through an access network to the user equipment initiating the video asset request.

23. (Previously Presented) The method of claim 22, wherein, when the identified server is the local server coupled directly to the requesting user equipment, the local server provides the requested video asset to the requesting user equipment via the access network.

24. (Previously Presented) The method of claim 23, wherein, when the identified server is one of the remote servers, the local server requests the requested video asset from the remote server and the remote server provides the requested video asset to the local server via an inter-server network.

25. (Previously Presented) An apparatus comprising:

- a server configured to distribute requested video assets to a requesting user equipment;
- a storage medium having a primary storage partition for storing frequently requested video assets and a secondary storage partition for storing infrequently requested video assets selectively distributed amongst a plurality of servers comprising at least a local first server and a remote second server; and
- a manager configured to control processing of video asset requests from the user equipment and distribution of video assets to the requesting user equipment, wherein the manager comprises:

a content manager configured to receive a request for a video asset from the requesting user equipment and determine whether the requested video asset is stored locally in the storage of the first server or stored remotely in the storage of the remote second server;

a stream session manager configured to direct the server to distribute requested video assets to the requesting user equipment; and

a content session manager configured to receive asset requests forwarded from the plurality of servers, identify and retrieve requested video assets requested by content managers the plurality of servers, and provide requested video assets to the plurality of servers,

wherein the manager, in response to an infrequently requested video asset becoming frequently requested, is configured to select and transmit the frequently requested video asset to at least one primary partition of at least one server;

wherein the manager, in response to a frequently requested video asset becoming infrequently requested, is configured to select and transmit the infrequently requested video asset to at least one secondary partition of at least one server.

26. (Cancelled)

27. (Previously Presented) The apparatus of claim 25, wherein the content manager, in response to determining that the requested video asset is stored locally, is configured to notify the stream session manager to deliver the requested video asset to a local server for transmission by the local server to the requesting user equipment.

28. (Previously Presented) The apparatus of claim 25, wherein the content manager, in response to determining that the requested video asset is stored remotely in the storage of a different server, is configured to instruct the stream session manager of a local server to contact the content session manager of the remote server.

29. (Previously Presented) The apparatus of claim 28, wherein the content session manager of the remote server is configured to identify the requested video asset in the storage of the remote second server and allocates bandwidth for transmitting the requested video asset.

30. (Previously Presented) The apparatus of claim 29, wherein, in response to a determination that the requested video asset is to be provided from the remote second server to the requesting user equipment via the first local server, the content session manager of the remote server is configured to notify the server of the remote second server to transmit the requested video asset to the first local server.

31. (Previously Presented) The apparatus of claim 30, wherein, in response to a determination that the server of the local first server is available to receive the requested video asset from the remote second server, the server of the remote second server is configured to stream the requested video asset to the local first server over an inter-server network.

32. (Previously Presented) The apparatus of claim 31, wherein the server of the local first server is configured to receive the requested video asset from the server of the remote second server, wherein the received video asset is stored in the storage of the local first server.

33. (Previously Presented) The apparatus of claim 29, wherein, in response to a determination that the requested video asset is to be provided directly from the remote second server to the requesting user equipment, the content session manager of the remote second server is configured to request the stream session manager of the remote second server to allocate bandwidth for providing the requested video asset to the requesting user equipment.

34. (Previously Presented) The apparatus of claim 33, wherein the stream session manager of the remote second server is configured to notify the server of the remote second server to stream the requested video asset to the requesting user equipment.
